

Eltecon Data Science Course by Emarsys

Introduction

Gábor Kocsis

September 11, 2019

RStudio project setup practice

1. Create a Github account if you do not have one already
2. Create a new public Github repository (name it eltecon-ds-class)
3. Create a new RStudio project with Version Control (clone your new repository from Github)
 - If you are using Windows git needs to be downloaded to your PC
4. You should make at least 2 commits throughout your work
5. Add the word 'data' to your .gitignore file
6. Create a directory in your project's working directory named 'data' and copy the sales.csv file into it
7. Install data.table and ggplot2 packages if not installed yet (use the `install.packages()` function), and load them in (use the `library()` function)
8. Create a file named analysis.R and write a short script in it that creates a simple chart using the sales.csv data
9. Update the README.md with a short description of your project
10. Push your working code to the remote repository
 - Note: You might need to set the email address you used on Github to be able to push by typing `git config --global user.email "YOUREMAILADDRESS@example.com"` in command line
11. Send your name and your repository's url to eltecon.ds kukac gmail pont com
